

X-TONE™

High Energy Focused Electromagnetic
Muscle Stimulator

X-TONE is a multifunctional body shaping and muscle building instrument. It is suitable for slimming, shaping, gaining muscle, dissolving fat, exercising vest lines and raising hips, good for health.

It is particularly effective for the buttocks and abdomen. It uses high-intensity focused electromagnetic (HIFEM) field technology to induce short-term bursts of strong muscle contraction, resulting in increased muscle density, reduced volume, improved clarity and improved tone.

It is the only way to help women and men build muscle and burn fat, and is the world's first non-invasive method of lifting hips.

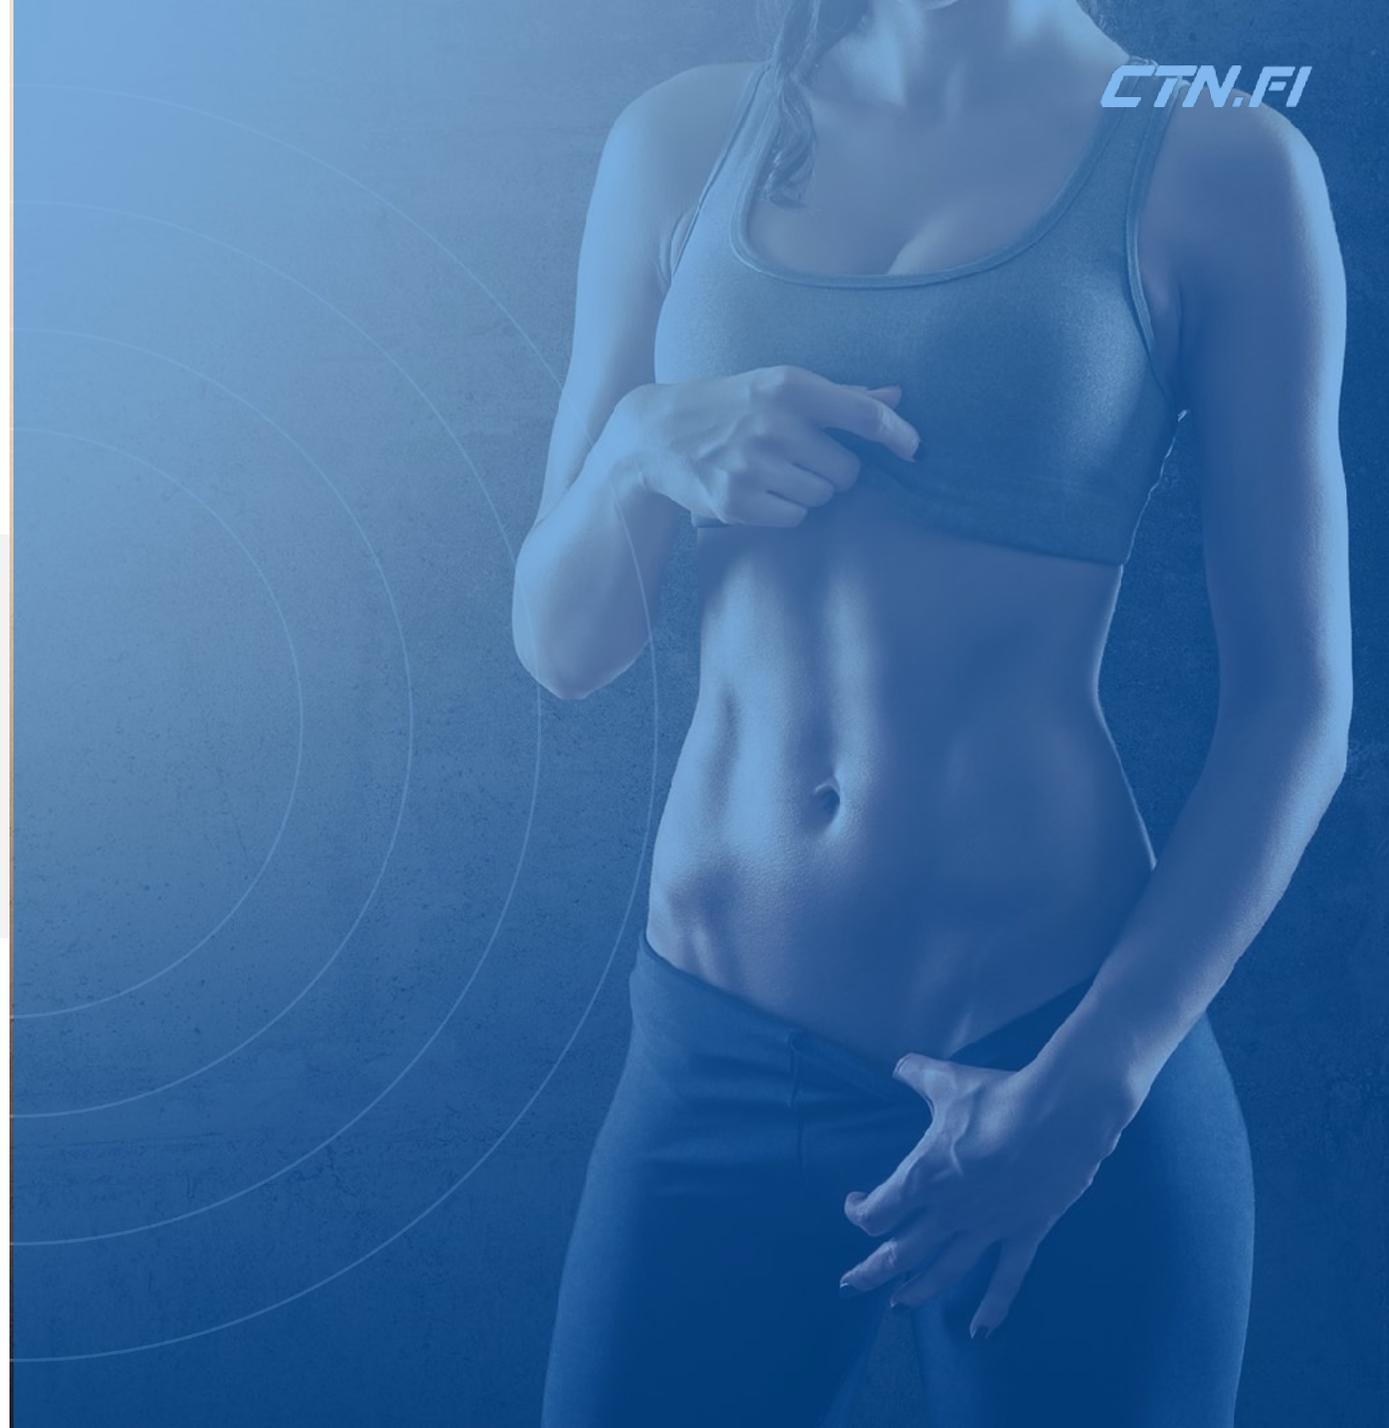

Introduction

X-TONE works by super-maximal contraction; muscle tissue is forced to adapt to this extreme condition. It responds by a profound transformation of the internal structure, which leads to muscle accumulation, tension, conditioning and burning fat. By reducing abdominal fat and at the same time building a muscle foundation under the fat, it helps patients achieve a slimmer and more athletic body contour. When applied to the buttocks, it can give the patient a more weight-lifting, sporty body shape. The heating/cooling principle is not used, so there is no risk of burns, scars or swelling. The recommended treatment plan is to perform four times, every time 30 minutes within two weeks. The best results will be seen after three months, and will continue to improve after six months. Can strengthen gluteal or abdominal muscles and burn fat.

Advantages

- Building muscles whilst burning fat
- Non-invasive hip lifting
- Suitable for everyone- no anaesthesia or surgery
- Short-term treatment, one time 30 minutes
- Only 4 sessions are required between 2-3 days
- Feels like an intensive exercise
- Safe without downtime
- The result is immediate, but it will be noticeable after two to four weeks.
- Muscle mass increased by an average of 16%
- Average fat loss 19%

How it works?

ABDOMEN **BUTTOCKS**

STRENGTHEN

49,500 times

high frequency
high intensity

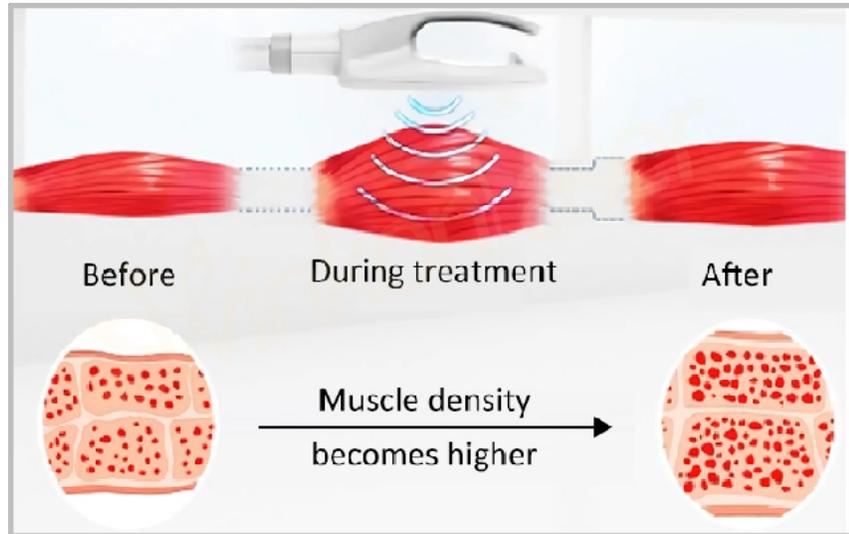

Electromagnetic field of HIEMT can target motor nerve cells to generate action potential, which directly stimulates muscle contraction. It can be said that “you can do exercise while lying down”.

During the 30minute treatment, the muscles are contracted 49,500 times with high frequency and high intensity, which cannot be achieved in general exercise!

Muscle extreme contraction requires a large amount of energy supply, so the fat cells next to the muscle are also consumed, leading to natural apoptosis and reducing fat thickness effectively. Muscle movements caused by HIEMT will not damage other joints or bones of the body, and it can effectively strengthen the muscles of the abdomen or buttocks, increase the number and volume of muscle fibres.

It makes the body lines more prominent, "mermaid line" and "The vest line" clearer.

Core principles

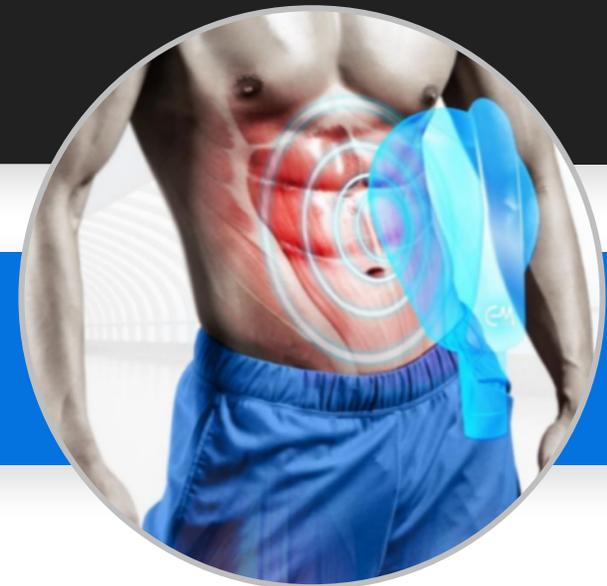

Through HIEMT (high energy focused electromagnetic wave) technology, autologous muscles can realize the ultimate training of continuous expansion and contraction, so as to deeply reshape the internal structure of muscles. It promotes the growth of myofibrils (muscle enlargement) to produce new protein chains and muscle fibers (muscle hyperplasia) and increases muscle density and volume through training.

Under HIEMT technology, the 100% limit muscle contraction movement can cause a large amount of fatty acid decomposition, fatty acid from the triglyceride decomposition outflow, in the fat cell a large amount of accumulation. Fatty acid concentration is too high, allowing adipocyte apoptosis, in a few weeks by the body normal metabolism out of the body.

X-TONE can strengthen and increase muscle, at the same time accomplish reducing fat effectively.

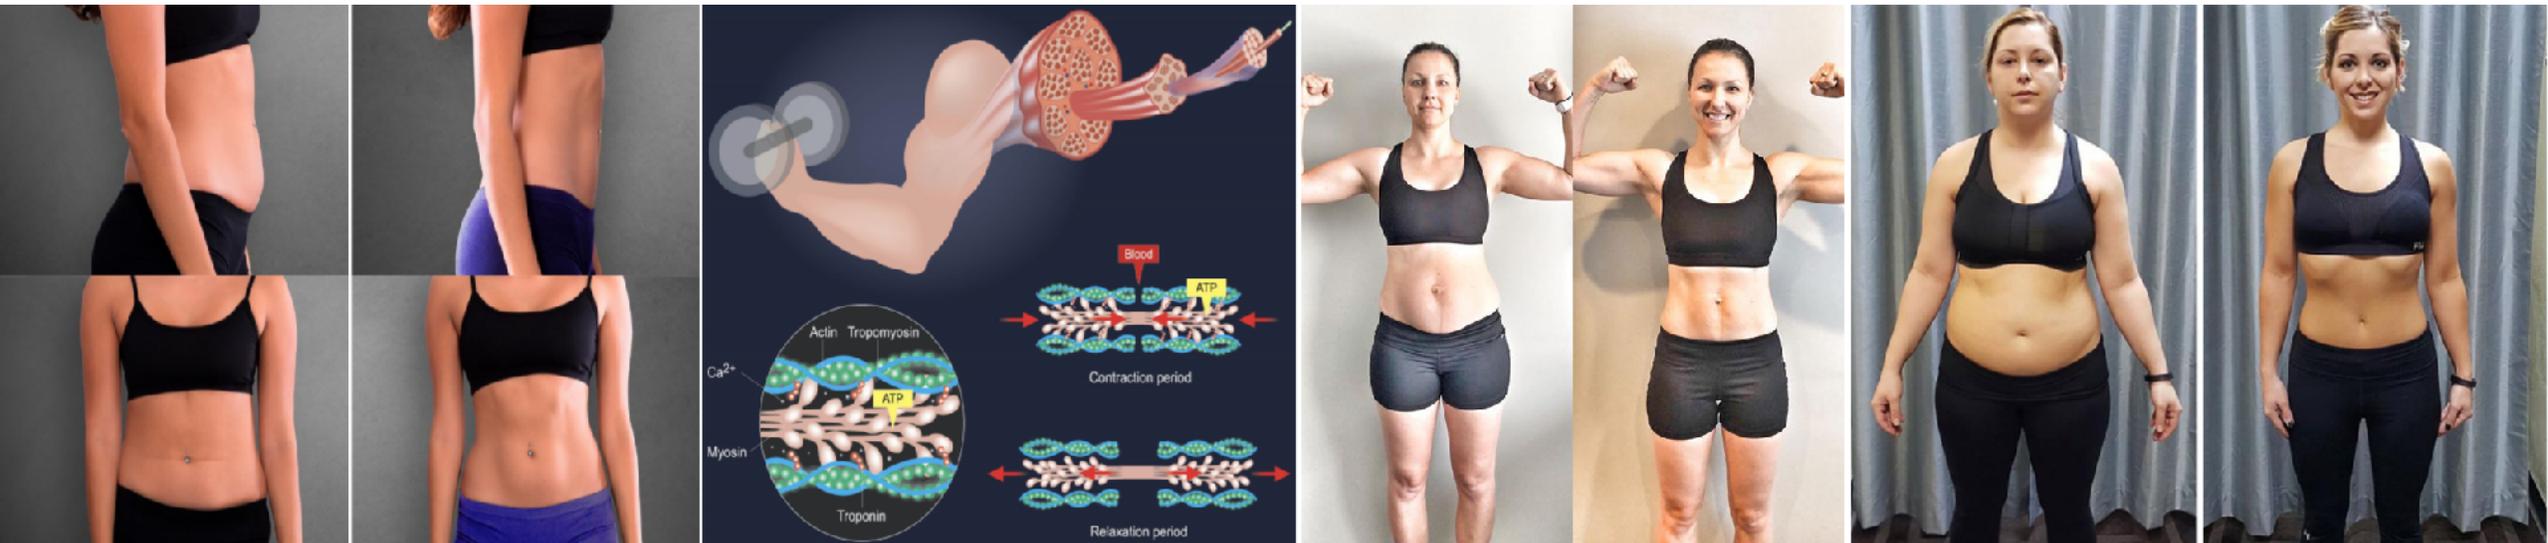

Free of ionization
Non-thermal
No radiation

Core principles

Use of HIEMT: A specific range of frequencies that do not allow the muscle to relax between successive stimuli, forcing the muscle to remain contractive for several seconds. Muscle formation occurs when muscle tissue is repeatedly exposed to these high load conditions.

Studies have shown that abdominal muscle thickness increases by an average of 15-16% one to two months after treatment with HIEMT.
